Using shinymeta

- 1. You (the app author) identify the domain logic in your app code so we can separate it from the reactive structure
- 2. Within that domain logic, you **identify references to reactive values and reactive expressions** that need to be replaced with static values and static code, respectively
- 3. At runtime, **choose which pieces** of domain logic to export, and in what order
- 4. **Present the code** to the user (in a window, as a downloadable script or report, etc.)

4. Options for presenting code to users

Use outputCodeButton() to add a button to a specific output

plotOutput("plot")
